In *The Nikon Autofocus System, 2nd Edition*, photographer Mike Hagen, author of the bestselling *The Nikon Creative Lighting System*, takes his deep knowledge of Nikon technology and concentrates on its focus features. In this book, which covers all current Nikon DSLR models (including the D5 and D500), Hagen fully explains how Nikon autofocus works, including detailed discussions of all the autofocus modules, drive systems, and camera buttons and menus. He also devotes an entire chapter to explore how focus works with Nikon's lenses.

Armed with this general knowledge, Hagen then dives deep and offers camera setups, settings, and best practices for specific field techniques that address the photographic genres that are notoriously challenging for focus: action and sports (indoor and outdoor), wildlife (including birds in flight), and macro photography. He also covers genres such as portrait, landscape, underwater, low-light, and street photography. Hagen not only advises on the best ways to set up the camera and focus systems, he gives helpful tips and tricks throughout the book.

The Nikon Autofocus System also covers:

- Live view autofocus methods and settings
- Achieving great focus in video
- AF tracking
- AF shooting styles, such as back-button AF and shutter-release AF
- HDR, panoramas, and other techniques for shooting with a tripod
- An entire chapter on additional terms and techniques, such as hyperfocal distance, calibrating lenses, focus and flash photography, and more

If an abend occurs during testing, Fault Analyzer enables the programmer to quickly and easily pinpoint the abending location and optionally, the failing line of code. Many times, this information is all the programmer requires to correct the problem. However, it might be necessary to delve a little deeper into the code to figure out the problem. Debug Tool allows the programmer to step through the code at whatever level is required to determine where the error was introduced or encountered. After the code or data is corrected, the same process is followed again until no errors are encountered. However, volume testing or testing with multiple terminals is sometimes required to ensure real-world reliability. Workload Simulator can be used to perform this type of testing. After all of the tests are completed, running the application by using Application Performance Analyzer can ensure that no performance bottlenecks are encountered. It also provides a baseline to ensure that future enhancements do not introduce new performance degradation into the application. Since the beginning of my memory I have always been fascinated with the sky and everything contained therein. Clouds, stars, moon and even the sun have always garnered my consistent attention and many hours both day and night I have stood captivated starting into the sky. As one my expect this volume contains photographs of the sky and its occupants, clouds, moon, sun in various combinations as presented by nature and any other entity who may claim responsibility for such a marvelous scene. I bow to all of you. For those interested in hardware and technique I will say that most of thee images were taken with a Nikon D600 fitted with a 500MM preset lens, a Nikon D5100 that has been converted to see in infrared and fitted with a 24-120MM Nikkor zoom lens. A few of them were even taken on film with a Pentax 645 fitted with various lenses. Can you imagine that, film! Ah, the film used was either Kodax Ektar 120 for the color work or Kodax

TMAX-100 for the monochrome. In all cases a tripod was used. It really doesn't matter which brand as any good tripod will serve you well. Mine was a Manfrotto fitted with a ball head. In all cases the camera was fired in a mirror up state with a cable release. Exposures varied between 1/30 - 1/125 of a second at f16 at iso 200 - why f16? The particular 500MM lens I used had an f-setting range of f8 through f32 and f16 is the sharpest setting for this individual lens. Vibration is not the only issue. When shooting at night for all about your in camera light meter. O be aware of. Atmospheric conditions can play a profound roll in the clarity of your images and cannot always be observed until examining the final images. If your images are not as sharp as you would like keep trying and remember that the atmosphere is less dense straight up than at the horizon. The vast difference between the bright moon and the black sky will render it all but useless. Try 1/30 sec at f16 or a combination thereof. One last thing of note. A 500MM lens is extraordinarily sensitive. So wait 5 to 10 seconds after you trip mirror up before you trip the shutter. Even a healthy breeze can ruin the sharpness of your images. I hope you enjoy the work contained herein.
